

# Azure Security Posture Improvement

Microsoft Defender for Cloud posture improvement across a 385-subscription enterprise Azure estate.

**385**

Azure subscriptions

**~67k**

Azure resources

**90%+**

Secure Score achieved

**0**

Critical findings

## CONTEXT

A large enterprise Azure estate required a consistent approach to cloud security posture management across hundreds of subscriptions and tens of thousands of resources. Defender for Cloud surfaced a significant volume of recommendations and exposure-related findings that required structured prioritisation, remediation and preventive governance.

## SCOPE

Technical ownership of the Azure security posture workstream across **385 subscriptions** and approximately **67,000 Azure resources**, covering Microsoft Defender for Cloud, Azure Policy, remediation automation and security reporting. The scope remained focused on posture and governance controls rather than broad Azure platform ownership.

## KEY WORK

- Established a structured remediation model for Defender for Cloud recommendations, prioritising critical and high-impact findings by exposure and security risk.
- Designed and implemented Azure Policy guardrails to prevent recurring configuration issues and aligned controls with Microsoft Cloud Security Benchmark.
- Automated remediation, reporting and follow-up through PowerShell, Azure DevOps, Power BI and ServiceNow workflows.
- Integrated security findings into operational remediation processes across application and platform teams.
- Shifted appropriate controls from reactive remediation toward preventive, secure-by-default governance.

## OUTCOMES

- **Secure Score:** improved from approximately 60-70% to 90%+ at enterprise scale.
- **Critical findings:** reduced to zero, with new critical issues remediated rapidly.
- **Exposure:** eliminated identified HTTPS/TLS findings and reduced unnecessary public exposure of database and storage services.
- **Operating model:** established repeatable posture-management processes across 385 subscriptions and ~67k resources.
