Critical issues

CONTEXT

The organisation needed a more usable and consolidated approach to cloud security posture management. Azure Defender for Cloud provided useful native coverage, but operating at scale through its UI was complex and time-consuming. At the same time, multiple acquired / venture environments used different cloud platforms and ownership models, with no direct operational access from the central team. Wiz was rolled out to provide a single CSPM view across Azure, AWS, GCP and Oracle Cloud.

SCOPE

Technical ownership of the Wiz workstream since **January 2024**, including platform rollout, governance design, access model, remediation processes, dashboards, exemptions / ignore rules, integrations and continuous posture improvement. The main Azure tenant represents roughly **90% of resources**; the remaining venture environments operate through collaborative, best-effort remediation models because central authority differs by tenant.

KEY WORK

- Rolled out Wiz across 12 cloud environments, consolidating posture visibility across Azure, AWS, GCP and Oracle Cloud into a single platform.
- Mapped findings to business service owners using Azure resource tags and defined remediation SLAs for critical and high issues / vulnerabilities together with IT security risk and compliance stakeholders.
- Designed scoped SSO access so business service owners can directly view the resources, findings and remediation context relevant to them.
- Established governance for exemptions, ignore rules and exceptions, while keeping built-in dashboards as the default and adding targeted custom dashboards where needed.
- Integrated Wiz with ServiceNow for ticketing and Vulnerability Response workflows; supplied Wiz data to Splunk, Microsoft Sentinel and executive Power BI reporting.
- Integrated Wiz CLI into Azure DevOps as a preventive control, enabling developers to identify issues before deployment and complementing runtime coverage across IaC, AKS, VMs and cloud resources.
- Designed the governance model for Wiz Kubernetes Agent coverage across approximately 50 clusters, with rollout and application integration performed by the respective application teams.

OUTCOMES

- **Critical risk:** reduced Wiz critical issues to **0** across the connected estate.
- **High severity:** reduced high-severity issues to **43** across the estate.
- **Owner response:** improved remediation response by giving service owners direct, scoped access to their own findings and resources.
- **Coverage:** improved visibility from code to deployed workloads and cloud resources through preventive scanning plus runtime CSPM coverage.
- **Consolidation:** created a single operating view across 12 cloud environments with different ownership models and cloud platforms.
- **Vulnerabilities:** critical and high vulnerability exposure decreased in collaboration with the dedicated vulnerability-management team.
